Module 5 – Presession (Clustering)

Key Takeaways

1. **Text Representation Matters:** TF-IDF improves text representation over simple word counts by reducing the weight of frequent words.
2. **Distance Metrics Are Crucial:** Different applications require different distance measures (Euclidean, Manhattan, Cosine).
3. **Clustering Techniques Differ:** K-Means requires predefined clusters, DBSCAN finds clusters dynamically, and KNN is supervised.

Relevant Questions

1. How does TF-IDF handle common words like "the" differently from Count Vectorization?
2. Why might DBSCAN be better than K-Means for identifying anomalies?
3. How does choosing different distance metrics (Euclidean, Cosine) affect clustering results?
